

## Claims

What is claimed as new and desired to be protected by Letter Patent of the United States is:

- 5           1. A demodulator for phase modulated (PM) signals comprising:  
          A direct phase sampler / digitizer;  
          A differencing circuit;  
          A "p" deep running averager;  
          A digital subtractor;  
10           A phase to amplitude converter.
2. A demodulator as in claim 1, wherein the direct phase digitizer provides the  
          instantaneous phase of the input signal, at the time of the clock transitions.
3. A demodulator as in claim 1, wherein a differencing circuit generates on every clock  
          cycle the phase difference in the input signal over the clock period.
- 15           4. A demodulator as in claim 1, wherein a running averager generates a running  
          average of phase differences over the last "p" consecutive phase differences.
5. A demodulator as in claim 1, wherein a subtractor subtracts the average phase  
          difference generated by the averager from the instantaneous phase difference  
          calculated by the differencing circuit and generates a digital data which indicates the  
20           instantaneous phase deviation.
6. A demodulator as in claim 1, wherein a phase to amplitude converter converts the  
          instantaneous phase deviation generated by the subtractor into an amplitude directly  
          proportional to the phase deviation.
7. A running averager as in claim 4, wherein "p" the depth of the averaging span  
25           determines the precision for the center frequency.
8. A phase to amplitude converter as in claim 6, wherein the conversion of phase  
          information into a voltage output is obtained by a sine lookup table followed by a  
          digital to analog converter.
9. A phase to amplitude converter as in claim 6, wherein the conversion of phase  
30           information into a voltage output is obtained by converting binary code presentation  
          of the phase information into a Grey code followed by further processing using EXOR  
          functions, bit drivers and a resistive network.
- ~~10. DELETED A demodulator for frequency modulated (FM) signals comprising:~~  
          ~~A direct phase sampler / digitizer;~~  
35           ~~A differencing circuit;~~  
          ~~A "p" deep running averager;~~  
          ~~A second "q" deep running averager~~

A digital subtractor;

A phase to amplitude converter.

11. ~~DELETAD~~ A demodulator as in claim 10, wherein the direct phase digitizer provides the instantaneous phase of the input signal, at the time of the clock transitions.

12. ~~DELETAD~~ A demodulator as in claim 10, wherein a differencing circuit generates on every clock cycle the phase difference in the input signal over the clock period.

13. ~~DELETAD~~ A demodulator as in claim 10, wherein a running averager generates a running average of phase differences over the last "p" consecutive phase differences.

14. ~~DELETAD~~ A demodulator as in claim 10, wherein a second running averager generates a running average of phase differences over the last "q" consecutive phase differences.

15. ~~DELETAD~~ A demodulator as in claim 10, wherein a subtractor subtracts the average phase difference generated by the averager from the instantaneous phase difference calculated by the differencing circuit and generates a digital data which indicates the instantaneous phase deviation.

16. ~~DELETAD~~ A demodulator as in claim 10, wherein a phase to amplitude converter converts the instantaneous phase deviation generated by the subtractor into an amplitude directly proportional to the phase deviation.

17. ~~DELETAD~~ A running averager as in claim 13, wherein "p" the depth of the averaging span determines the precision for the center frequency.

18. ~~DELETAD~~ A second running averager as in claim 14, wherein "q" the depth of the averaging span of the second averager determines the bandwidth of the demodulated signal output.

19. ~~DELETAD~~ A phase to amplitude converter as in claim 16, wherein the conversion of phase information into a voltage output is obtained by a sine lookup table followed by a digital to analog converter.

20-20. A phase to amplitude converter as in claim 6, wherein the conversion of phase information into a voltage output is obtained by converting binary code presentation of the phase information into a Grey code followed by further processing using EXOR functions, bit drivers and a resistive network.

21. ~~DELETAD~~ An FM or PM receiver comprising:

A quadrature input signal generator;

A direct digital phase digitizer;

A digital demodulator.

22. ~~DELETAD~~ A receiver as in claim 21, wherein the quadrature generation may be obtained by quadrature down conversion or by any type of quadrature power splitter.

23. ~~b DELETAD~~ A demodulator as in claim 21, wherein the direct phase digitizer provides the instantaneous phase of the input signal, at the time of the clock transitions.
24. ~~DELETAD~~ A receiver as in claim 21, wherein the demodulator contains no tuned or resonant circuits and wherein the operation of the demodulator is controlled by a clock.
25. ~~DELETAD~~ A converter to convert binary code presentation of the phase of a signal into a magnitude of voltage or current comprising:  
EXOR Logic to convert the binary code into Grey code;  
EXOR logic to generate specific driver code;  
A resistive network to convert the drive code into a voltage or current.
26. ~~DELETAD~~ A converter as in claim 25, wherein the conversion of binary code to Grey code is obtained using the formula  $G_n = B_n \oplus B_{n+1}$ , and wherein  $G_n$  represents a Grey code bit n and  $B_n$  represents a binary code bit n.
27. ~~DELETAD~~ A converter as in claim 25, wherein the drive code is obtained from the Grey code using the formula  $D_k = G_k \oplus G_{k+1} \oplus G_{k+2} \oplus \dots \oplus G_n$ , and wherein  $D_k$  represents a drive bit k.
28. (NEW) A digital demodulator for phase modulated (PM) signals wherein a digital input is a digital presentation of the instantaneous phase of the modulated signal.
29. (NEW) A demodulator for phase modulated (PM) signals as in claim 11 comprising:  
A differencing circuit;  
A "p" deep running averager;  
A digital subtractor;  
A phase to amplitude converter.
30. (NEW) A demodulator as in claim 29, wherein a differencing circuit generates on every clock cycle the phase difference in the input signal over the clock period.
31. (NEW) A demodulator as in claim 29, wherein a running averager generates a running average of phase differences over the last "p" consecutive phase differences.
32. (NEW) A demodulator as in claim 29, wherein a subtractor subtracts the average phase difference generated by the averager from the instantaneous phase difference calculated by the differencing circuit and generates a digital data which indicates the instantaneous phase deviation.
33. (NEW) A demodulator as in claim 29, wherein a phase to amplitude converter converts the instantaneous phase deviation generated by the subtractor into an amplitude directly proportional to the phase deviation.
34. (NEW) A running averager as in claim 31, wherein "p" the depth of the averaging span determines the precision for the center frequency.

35. (NEW) A phase to amplitude converter as in claim 33, wherein the conversion of phase information into a voltage output is obtained by a sine lookup table followed by a digital to analog converter.

5

36. (NEW) A phase to amplitude converter as in claim 33, wherein the conversion of phase information into a voltage output is obtained by converting binary code presentation of the phase information into a Grey code followed by further processing using EXOR functions, bit drivers and a resistive network.
